

Press Release

UltraMAP attends WindEurope for the first time to promote technology and services proven to help protect subsea cables and offshore assets

Newcastle, United Kingdom

UltraMAP, the home of AssetMonitor, providing protection to subsea and offshore assets, will be attending the WindEurope Offshore exhibition in Copenhagen from the 26th- 28th November. This will be the first time the company have attended this exhibition.

Martin Connelly, Commercial Director at UltraMAP says:

“In the world of Renewable Energy, billions of pounds worth of assets sit above and below the surface of our oceans. Here at UltraMAP we aim to help protect these surface assets and subsea cables for you, whether you’re an individual company or part of a consortium.

*With **AssetMonitor** providing live 24/7 web-based, ocean monitoring, nothing happens to our customers assets without UltraMAP knowing. The benefits AssetMonitor can bring to companies within the Renewable Energy Industry are very important.”*

As the Renewable Energy Industry increases so does the amount of marine assets in our oceans. They all need some form of protection ... while they are being installed and throughout their life.

The ways that AssetMonitor can be of benefit include:

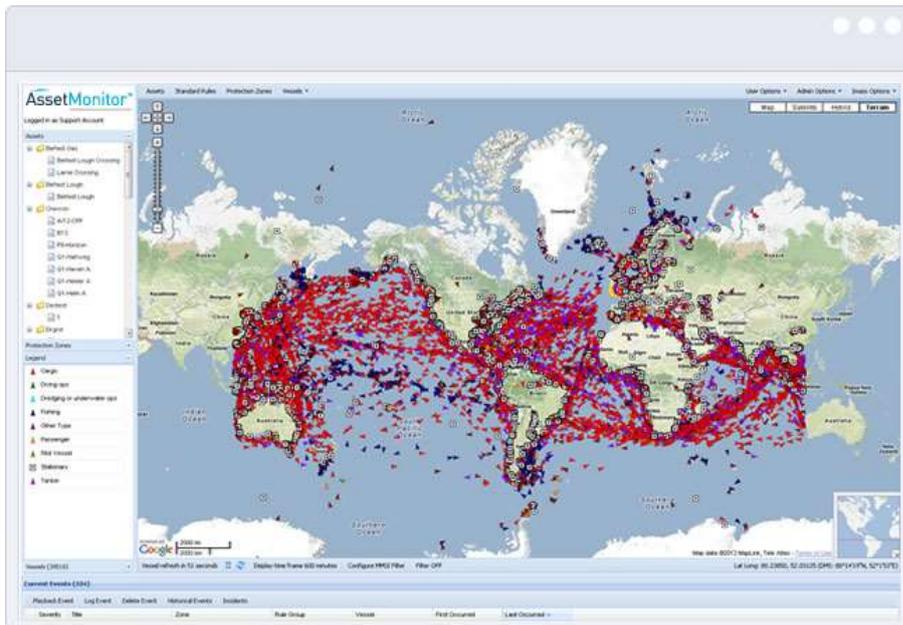

- Protecting offshore wind turbines
- Protecting and preventing damage to tidal or wave generators
- Protecting and preventing damage to subsea power cables
- Protecting our interactive environment by allowing safe transport of energy underwater

Protecting subsea and surface assets can save companies a lot of time, effort and money as well as providing peace of mind that they are being constantly monitored.

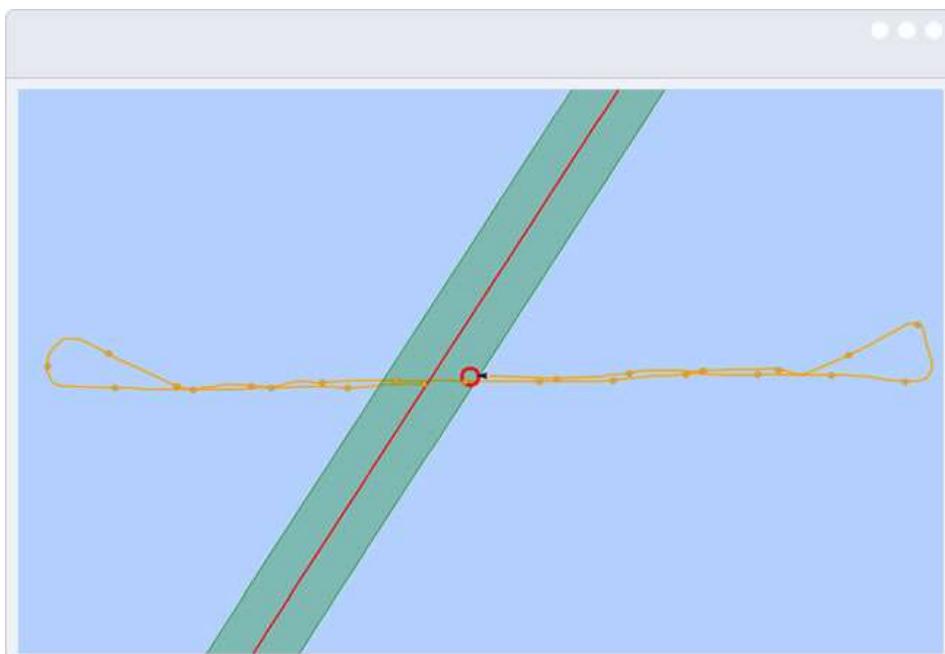

With AssetMonitor, subsea and surface assets can be monitored 24/7 for any vessel activity around protected zones, raising an alarm if a vessel enters the protected zone. UltraMAP can then decide whether the vessel is a threat to the subsea or surface assets. No fuss, no drama, no worries. Just guaranteed protection.

You can visit the company on stand E-D50 in the Bella Centre, Copenhagen, Denmark.

Images

This is a visual representation of the AssetMonitor service. UltraMAP monitors assets and movements on a global basis. This image gives an indication of how many vessels are operating worldwide on a daily basis.

This image highlights how the service can be used to track vessel movements around a cable in its protection zone (cable: red, protection zone: green).

Note to editor

AssetMonitor has been running on a constant watertight basis for 10 years, since UltraMAP first created it in 2009.

UltraMAP is a focussed, successful business with worldwide customers, offering protection in Europe, Asia, Middle East, Africa, Australia, New Zealand and USA.

So, if you're a company with assets 'in or on' the oceans, or involved in their maintenance we recommend you **get in touch with the UltraMAP team**. Whether your work is connected to wind farms, tidal energy farms, oil rigs and platforms or specifically with subsea cables, we'll help you to keep your assets safe.
