Department of Electrical Engineering

Outline

- Introduction
- Wind power model
- Model development – Stochastic Approach
- Case study
- Conclusions

Introduction

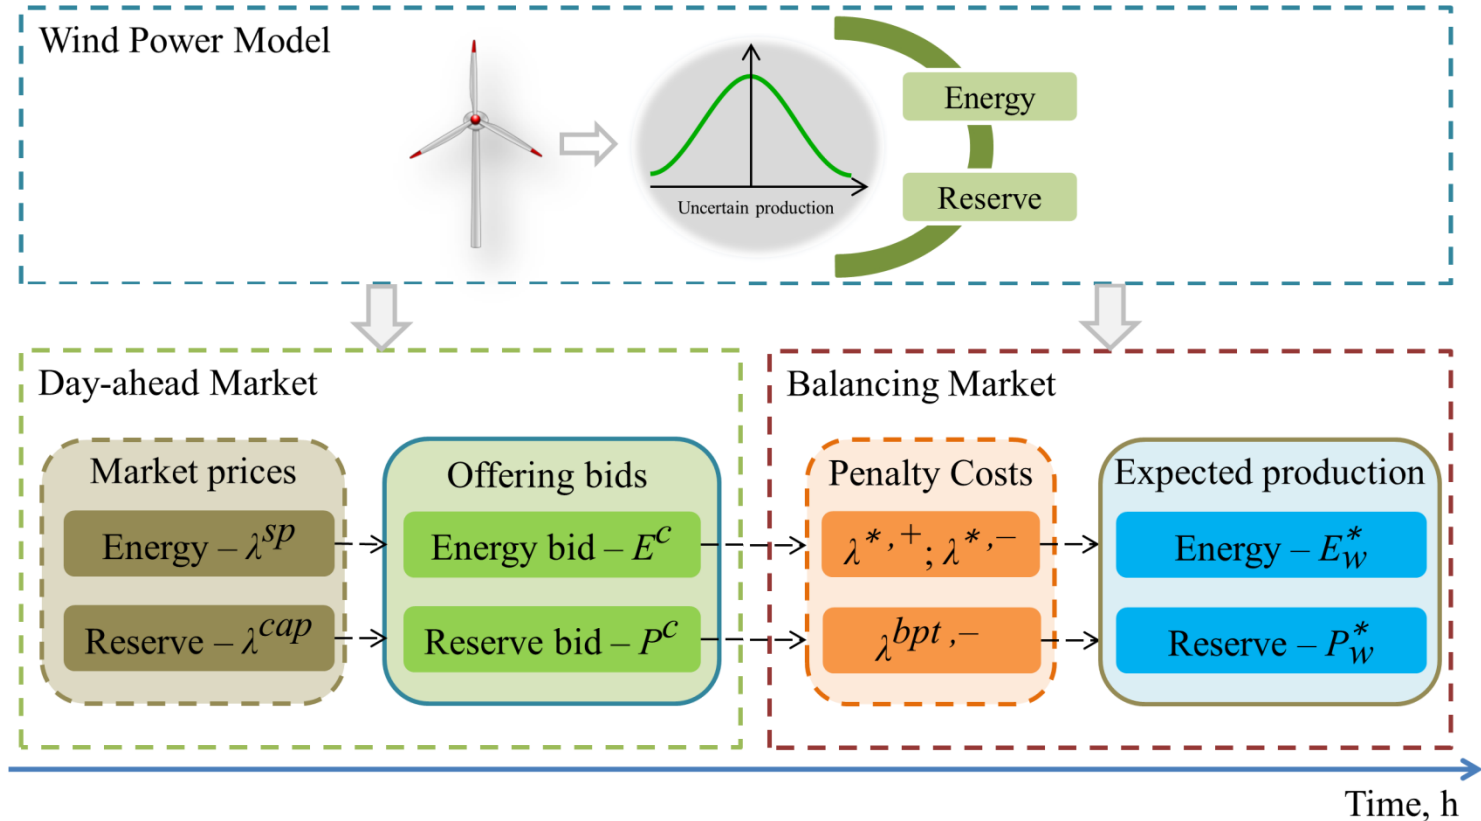

Introduction
Wind Power Model
Model Development
Case Study
Conclusions

- Increasing wind power penetration in power systems
- New business models (energy and ancillary services)
- Maximizing expected return

Wind power participation model

- Introduction
- Wind Power Model
- Model Development
- Case Study
- Conclusions

Proportional wind offering strategy

Introduction
Wind Power Model
Model Development
Case Study
Conclusions

Q - Total power bid
 P^c - Reserve contracted (offered)
 E^c - Amount of energy offered
 α^c - Strategy parameter for controlling the share of energy and reserve (between 0 and 1)

Mathematical formulation

Introduction
Wind Power Model
Model Development
Case Study
Conclusions

- Objective function

$$\text{Maximize } R = \lambda^{cap} P^c + \sum_{w \in \Omega} \pi_w \left[\lambda^{sp} E_w^* - T_w^* - W_w^* \right]$$

$$T_w^* = \begin{cases} \lambda^{*,+} (E_w^* - E^c), & E_w^* - E^c \geq 0 \\ -\lambda^{*,-} (E_w^* - E^c), & E_w^* - E^c < 0 \end{cases}$$

$$W_w^* = \begin{cases} \lambda^{bpt,+} (P_w^* - P^c), & P_w^* - P^c \geq 0 \\ -\lambda^{bpt,-} (P_w^* - P^c), & P_w^* - P^c < 0 \end{cases}$$

- Subjected to

$$\begin{aligned} E^c &= \alpha^c Q \\ P^c &= (1 - \alpha^c) Q \end{aligned} \quad \left. \vphantom{\begin{aligned} E^c &= \alpha^c Q \\ P^c &= (1 - \alpha^c) Q \end{aligned}} \right\} \text{Day-ahead constraints}$$

$$\begin{aligned} E_w^* &= \alpha_w^* E_w^{obs} \\ P_w^* &= (1 - \alpha_w^*) E_w^{obs} \end{aligned} \quad , \forall w \in \Omega \quad \left. \vphantom{\begin{aligned} E_w^* &= \alpha_w^* E_w^{obs} \\ P_w^* &= (1 - \alpha_w^*) E_w^{obs} \end{aligned}} \right\} \text{Balancing stage constraints}$$

$$\alpha_w^* = \alpha^c \quad , \forall w \in \Omega \quad \longrightarrow \text{Non-anticipativity constraint}$$

Case study – numerical example

Introduction
Wind Power Model
Model Development
Case Study
Conclusions

- Wind power producer - 15 MW

- Prices and penalty costs in energy and reserve market

Energy	Price (€/MWh)	Reserve	Price (€/MW)
λ^{sp}	40	λ^{cap}	41
$\lambda^{c,+}$	30	$\lambda^{bpt,+}$	0
$\lambda^{c,-}$	50	$\lambda^{pt,-}$	96

Case study – results

Introduction
Wind Power Model
Model Development
Case Study
Conclusions

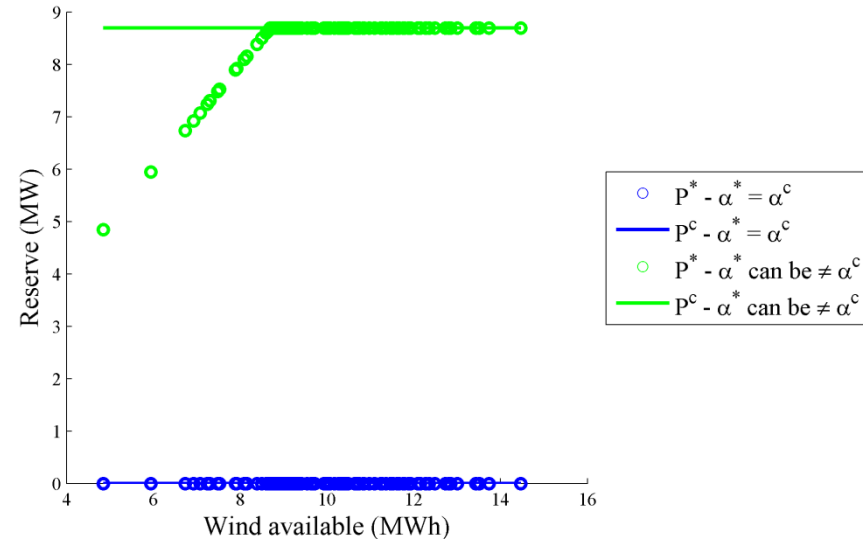

- The standard approach offers only to the energy market, since the gain from participating in the reserve market is not much higher than participating in energy-only (risk adverse behaviour)
- In contrast, flexible approach offer in both markets, thereby, increasing the expected revenue (risk neutral behaviour)

Case study – results

Introduction
Wind Power Model
Model Development
Case Study
Conclusions

- For lower levels of available wind power (until $P^* = P^C$), the flexible approach allocates all the available power to the reserve market, where the penalty for failing is higher.
- Flexible approach improves the revenue in about 2%

Conclusions

Introduction
Wind Power Model
Model Development
Case Study
Conclusions

- The results strongly depend on the **prices and penalties** for energy and reserve
- The use of proportional strategy may be able to provide **additional profits** to wind power plants, in expectation
- The standard strategy performs a **risk averse behaviour** where all the available energy is submitted in either energy or reserve market.

Market design implications

Introduction
Wind Power Model
Model Development
Case Study
Conclusions

- Allowing wind power plant to bid in the **energy and reserve market** may require some changes in the market design.
- Time for service provision availability. Bring energy and reserve market closer to the delivery.
- Reducing the minimum size bids / aggregation of bids
- Prediction intervals for availability concerns

Thank you!
