

Commissioning

The commissioning is a crucial stage of the life cycle of a wind turbine. After the completion of the electrical installation phase, the wind turbine must be tested before starting the wind energy generation. Its commissioning ensures the machine achieves its performance goals and that it complies with the original design specifications and requirements set by the customer.

Endiprev has specialized teams with experience in the commissioning of wind turbines, both onshore and offshore wind farms. This service allows the technicians and engineers to run a series of vital checks and to address any issues before it connects to the grid and becomes fully operational.

The process is carried out in close cooperation with every department giving support to the team on the field and with the customer to guarantee that its goals are fulfilled on-time, on-budget, and with the highest quality standards. Endiprev's team has already performed commissioning services in more than 2000 wind turbines around the world, totalizing more than 5GW.
